

The Seasons

We all know the four seasons are winter, spring, summer and autumn, or fall. Have you ever wondered what the reason is for the four seasons? The cycle of weather changes is divided into four equal parts. These are the seasons.

The Seasons

Seasons are related to the way sunlight falls on different parts of the Earth, over a year. The Earth revolves around the Sun. For half the year, the North Pole is tilted towards the Sun. The Northern Hemisphere gets more sunlight than the Southern Hemisphere.

The Seasons

During the other six months, the North Pole tilts away from the Sun. The Southern Hemisphere gets more sunlight and daylight each day.

The Seasons

When the Northern Hemisphere gets sunny, it gets the warm seasons (spring and summer). At this time, the Southern Hemisphere gets the colder seasons (autumn and winter).

The Seasons

In winter, we get cold weather and snow in some places. Some animals will hibernate and sleep for a long time. Some birds will migrate to warmer places.

The Seasons

The Seasons

In springtime, it gets warmer. We see blossom and new leaves on trees. Animals climb out of their dens and nests.

The Seasons

In summer, there are more hours of daylight and the sun is stronger. Plants grow even faster. The fields grow crops quickly. In autumn, the temperature drops. Some plants and trees will lose their leaves. Then the cycle to winter begins again.
