

The Universe

The universe. What is it? How can we understand the universe? And, did you know that the universe is everything?

The Universe

The universe includes time, space, matter, energy, light, and everything else in between. It includes all living things. We know that the universe is huge.

The Universe

Planets, stars, moons, galaxies are all part of our beautiful universe. The universe contains billions of galaxies, and each galaxy contains millions or billions of stars. On Earth, we are in what we call the Milky Way galaxy.

The Universe

We do know what a solar system is. A solar system is made when a planet, or a few planets, orbit around the same star. There is a gravitational bond between this star (sun) and the objects that orbit it.

The Universe

Space is filled with radiation, in the form of light and heat. Space is also filled with magnetic fields and cosmic rays. There is no sound in space. There is no atmosphere in space.

The Universe

The Universe

The Universe

We know that the universe has not always been the exact same size. Scientists believe that it all began in a Big Bang, taking place 14 billion years ago. One huge thing that we do know is that the universe is expanding. Galaxies are moving further apart as the space between them is expanding.

The Universe

There is still so much we do not know about the universe. Scientists do not know the exact size or shape of the universe. Some scientists argue over these ideas. What we do know is that our beautiful universe is everything.
