Birds and Beaks

Birds have different kinds of beaks. Beaks tell us a lot about what birds might enjoy to eat.

2

oy ir ue (/oo/ and /y-oo/)

Birds may be small but they do like to eat a lot. Birds have a beak. Beaks can tell us some clues about a bird and what they like to eat.

A sparrow has a small, short beak. With this beak, it can pick up and eat seeds and insects such as ants.

A pelican's beak acts like a fishing net. An eagle's beak is sharp and strong. It can grab small animals to eat.

Birds do not have teeth. Birds do not chew their food like we do. Birds use their beak to gather food.

Birds with big, short beaks like to eat things like seeds and nuts. Parrots like to eat nuts, seeds and insects. With a big beak and a strong jaw, a parrot can break open hard shells to get into the seeds and nuts.

Birds with a long, thin beak like to reach into flowers. Hummingbirds have long, thin beaks. Hummingbirds can sip and drink the sweet nectar.
