Your Brain, Your Supercomputer

The brain will keep growing until we are around 20 years old. It keeps making connections throughout our lives. We can continue to learn new things because of our supercomputer brain.

How much do you know about your brain? The human brain acts like a supercomputer. The brain sends signals to all parts of your body. Read on to learn some more interesting facts about your brain.

The brain keeps on working when we sleep. It controls our dreams and our memories.

Our brain contains billions of cells called neurons. Chemical and electrical signals race between the neurons. Messages are sent along neuron pathways.

The brain is an organ that sits inside our skull. It is protected by fluid inside the skull.

Our brain controls everything that our body does. Our brain takes the lead role in how we think, feel, learn and move. Every minute of every day, it tells our body what it needs to do.

Think about when you hear something, see something, taste something or smell something. This is our brain sending us signals out of microscopic cells from all over our bodies.
