7 -er

Stem Cell Research

Written By Anna Kirschberg

Phase 6 - Suffixes

-s and -es	-ing	-ed
-er	-est	un-

-er Suffixes

er	Drop	Nothing
researcher	healthier *	researcher
faster	earlier *	faster
healthier	* Change y to i and add er	
earlier		

Teachers / Parents

These readers have been written with rich vocabulary including embedded words that contain suffixes. Discuss the use of suffixes for changing the meaning of words and the spelling rules applied. The text consolidates earlier taught phonics skills and heart words.

Phase Six - Non-Fiction (Discoveries & Inventions)

1. The Power of X-Rays
2. The History of Vaccines
3. Inventing the Telephone
4. Inventing the Lightbulb
5. Marie Curie
6. Devoted to the Soil
7. Stem Cell Research
8. Josephine's Dishwasher
9. The Wheel
10. Discovering Genetics
11. The Computer Programmer
12. Central Heating Systems

Stem Cell Research

The impact of stem cell research and its discoveries will help researchers in the medical field for years to come and will continue to save many lives.

Have you heard of stem cells before and wondered what they are? Stem cells are special and unique cells that can develop into a range of blood cells in our bodies. Stem cells are highly valued in medical research because of their restorative properties.

Stem cell research has revolutionised many advancements in medical treatments and the potential development of cures for diseases such as cancer.

Ann is considered one of the key scientists in cancer cure research. Cancer research uses stem cells. Advances in disease prevention and treatment have been made possible by Ann's earlier work.

Medical researchers can grow stem cells in the lab. Stem cells can mature into different cell types in the body. This means scientists can open up possibilities for the treatment of various diseases faster. Stem cells can work to repair the body and make it healthier.

Stem cell treatments and transplants can help people with blood or immune diseases, forms of cancer and autoimmune diseases.

Ann Tsukamoto is one female scientist that has been credited with discovering blood stem cells and inventing a way to isolate them. This allows research to be carried out on stem cells without any interference from other types of cell.
