

Stem Cell Research

Have you heard of stem cells before and wondered what they are? Stem cells are special and unique cells that can develop into a range of blood cells in our bodies. Stem cells are highly valued in medical research because of their restorative properties.

Stem Cell Research

Medical researchers can grow stem cells in the lab. Stem cells can mature into different cell types in the body. This means scientists can open up possibilities for the treatment of various diseases faster. Stem cells can work to repair the body and make it healthier.

Stem Cell Research

Stem cell treatments and transplants can help people with blood or immune diseases, forms of cancer and autoimmune diseases.

Stem Cell Research

Ann Tsukamoto is one female scientist that has been credited with discovering blood stem cells and inventing a way to isolate them. This allows research to be carried out on stem cells without any interference from other types of cell.

Stem Cell Research

Ann is considered one of the key scientists in cancer cure research. Cancer research uses stem cells. Advances in disease prevention and treatment have been made possible by Ann's earlier work.
